
MINIMISING RISKS, MAXIMISING OPPORTUNITIES:
MEETING GROWING DEMAND FOR CLIMATE DISCLOSURE

The Task Force Changes the Game. Created by the G20’s Financial Stability Board, the TCFD provides a full framework for reporting governance and management of physical and transition climate-related risks under projected warming and decarbonisation scenarios. It provides guidelines for high-risk industries: Energy, Transportation, Materials and Buildings, and Agriculture, Food, and Forest Products.

Challenge

Regulators and investors’ demands for climate disclosure continue to grow. Now, the findings of the Task Force on Climate Related Financial Disclosures (TCFD) recommend corporates disclose risks in mainstream financial filings under a consistent reporting framework for the first time.

Solution

South Pole Group has a range of corporate advisory and assessment tools to help companies successfully identify, quantify, and disclose climate risks in line with TCFD recommendations. By better understanding the climate risks it faces, your company can reduce costs, increase resilience, and grasp opportunities in its operations and supply chains.

Our services help you develop a climate edge and demonstrate it to your shareholders and customers by exhibiting a transparent and proactive approach to reporting on risks, goals and progress, and seizing low-carbon, climate-resilient opportunities.

OUR SERVICES

Climate governance and reporting

High-level advisory to help understand the new strategic landscape in climate disclosure; assessments of businesses' current practices, opportunities for improvement, and potential new products and services; and support with TCFD disclosures.

Risk exposure and management tools

Our assessment tools categorise the major physical and transition risks by business type and conduct independent risk forecasts along the value chain. Our team will develop and embed an updated risk register and scoring and classification procedures to ensure best practice.

Scenario development and financial risk assessment

Development of bespoke warming and decarbonisation scenarios and an in-depth assessment of operational and supply chain risks, including economic analysis and recommendations for climate mitigation and adaptation.

Greenhouse Gas (GHG) footprinting and target setting

Carbon accounting for operations and product life cycles, setting science-based targets and developing indicators to allow businesses to report against the Sustainable Development Goals.
